Correlation of SWE products with snow course data

LRM mean: 0.59

SNODAS mean: 0.37

Avg SWE Tuolumne Basin – Comparison w/ ASO

- Regression models show better agreement with ASO than SNODAS

SWE products

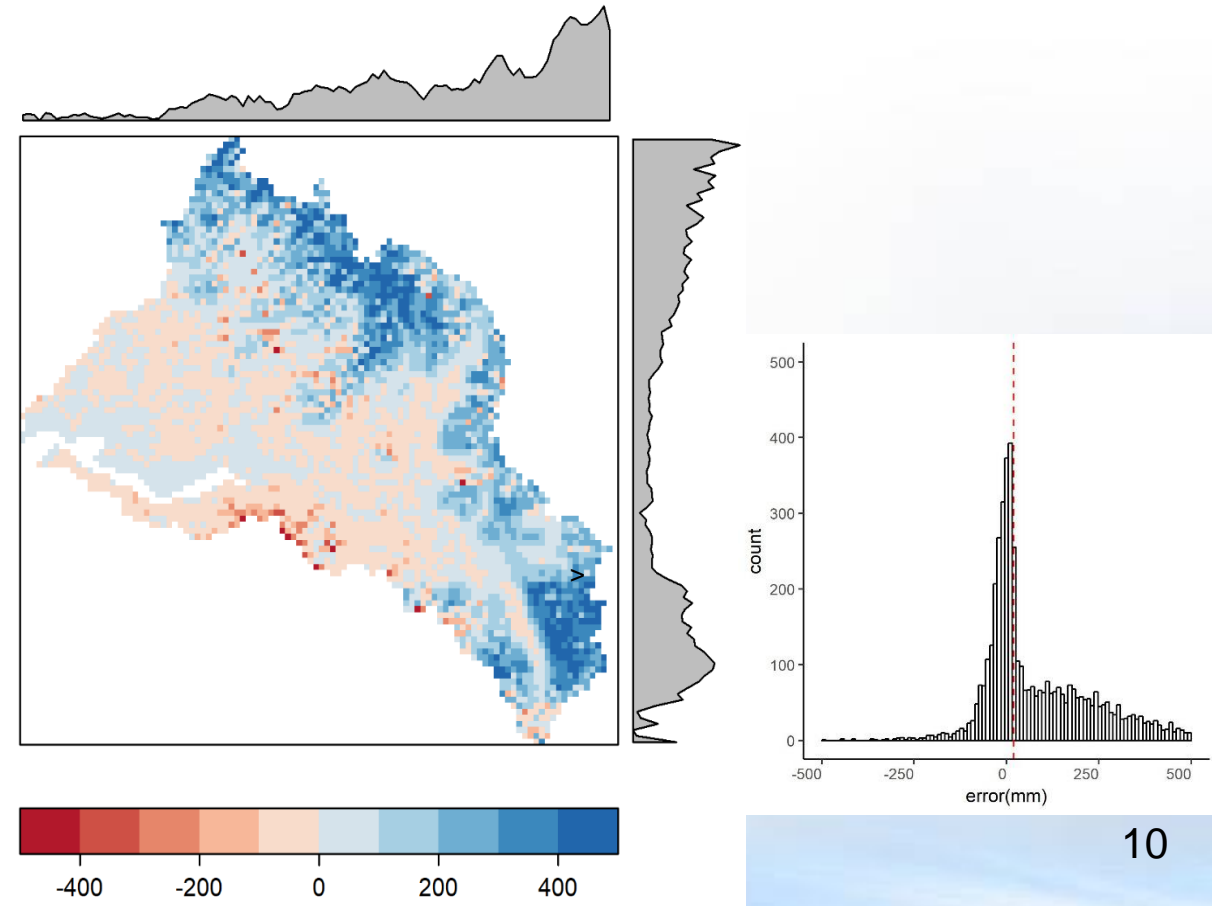

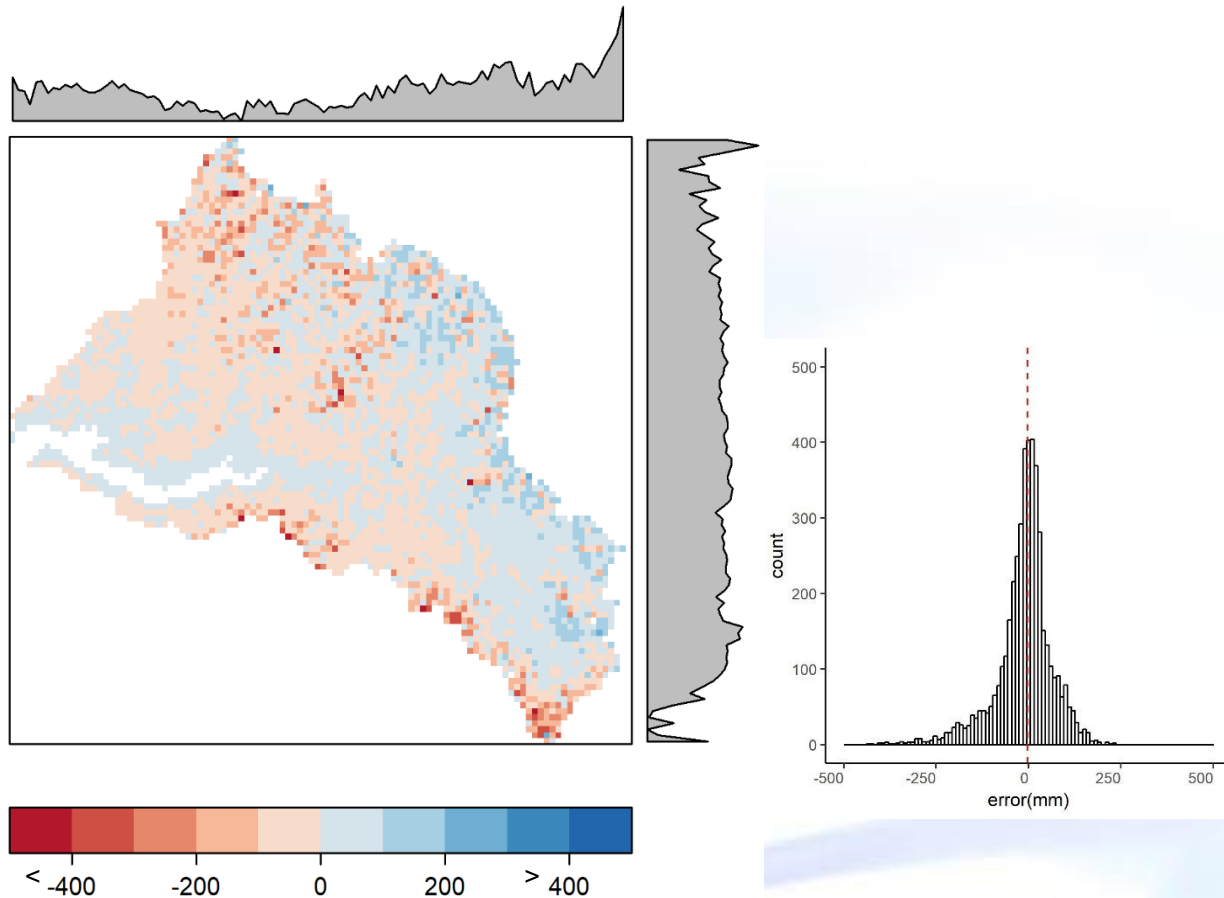

Difference Between ASO and LRM/SNODAS

Low SWE day (2015-04-09) | ASO: 114 mm

LRM: 103 mm

SNODAS: 197 mm

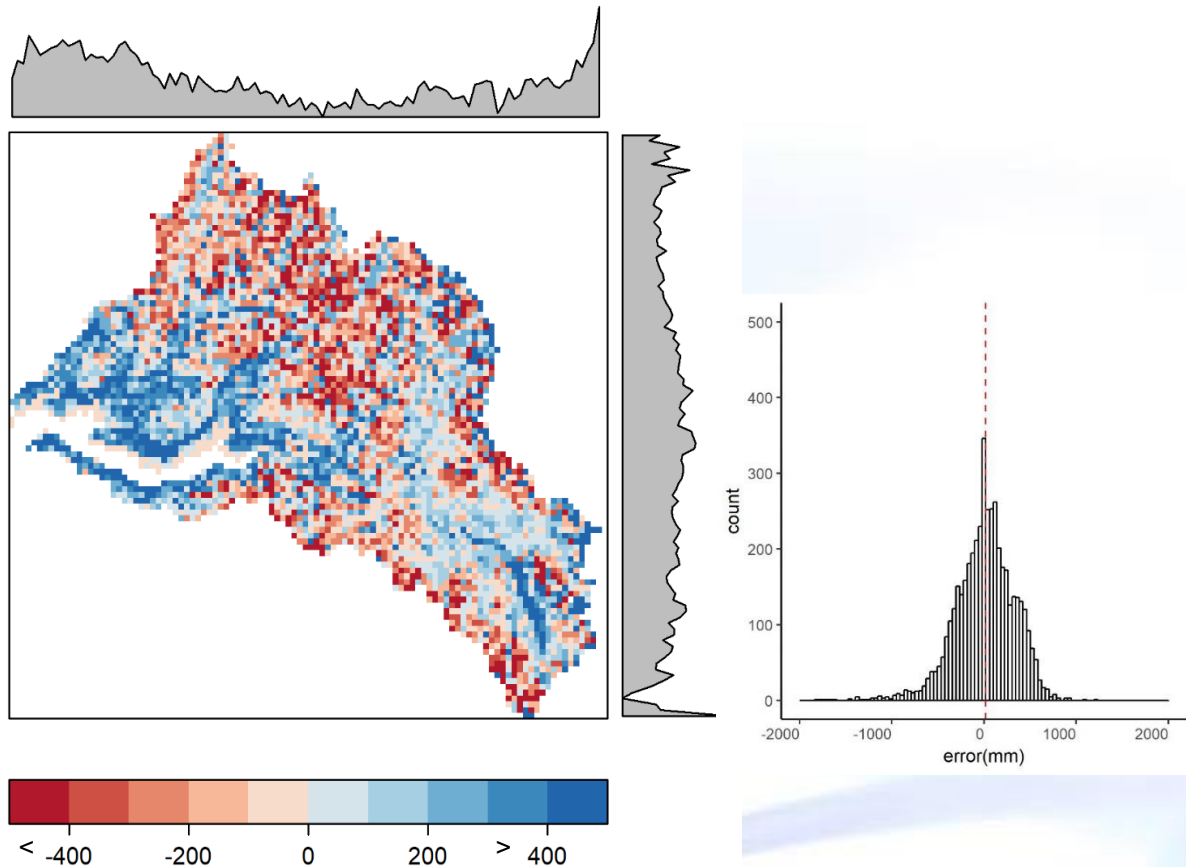

Difference Between ASO and LRM/SNODAS

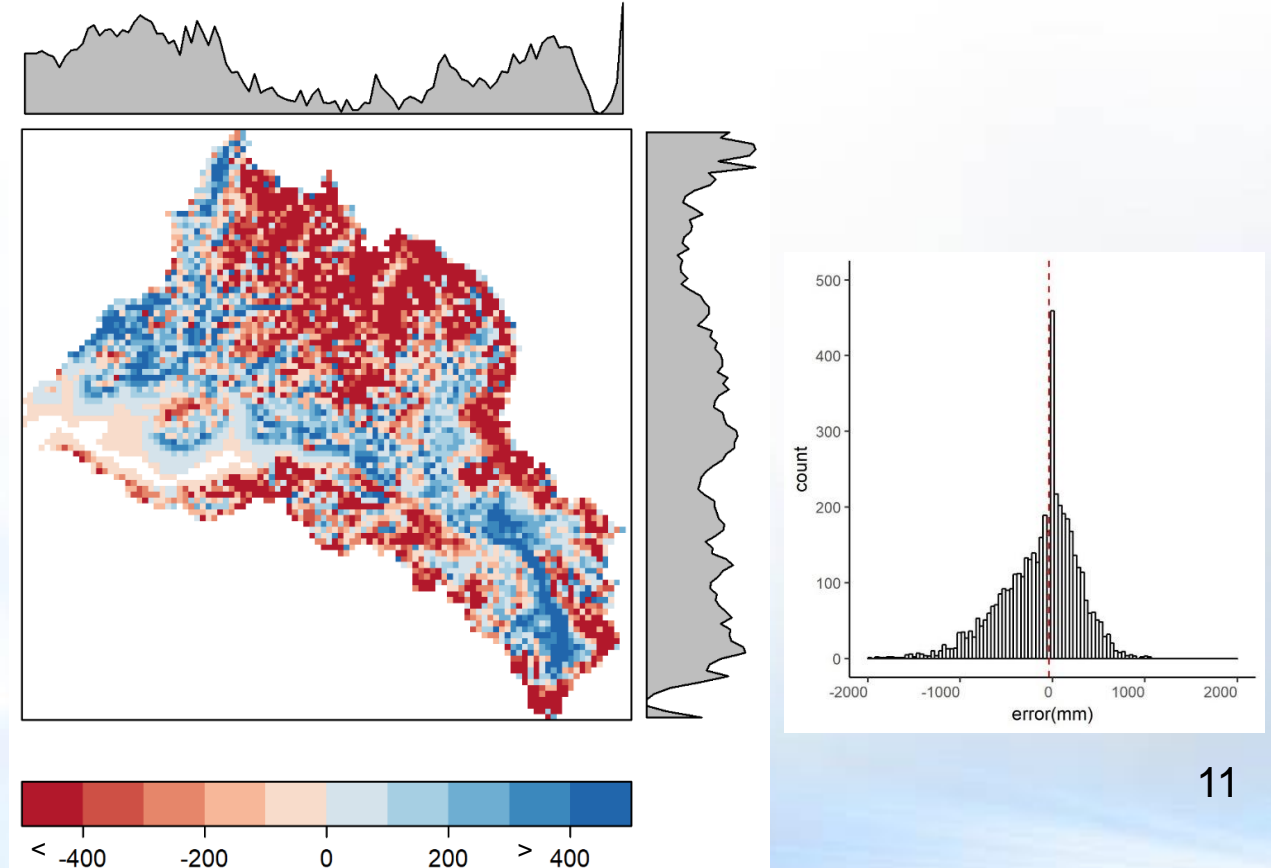

Average SWE day (2016-03-26) | ASO: 720 mm

LRM: 737 mm

SNODAS: 590 mm

Using ASO to bias correct SWE estimates

- Correlate bias with terrain variables
- Highest correlation with Elevation
- Effects of forest cover and aspect are secondary

January storms erase part of California's snowpack deficit

Heavy Rainfall and Full Reservoirs: Does SWE matter?

From: Anderson, Michael L.@DWR [<mailto:Michael.L.Anderson@water.ca.gov>]

Sent: Wednesday, January 25, 2017 5:55 PM

To: Noah Paul Molotch <Noah.Molotch@colorado.edu>

Subject: Re: map of SWE anomaly for press release

Hi Noah

Read your press release. Some things to note are that we can have floods during droughts due to the nature of atmospheric river events so notion of floods as the opposite of Drought isn't a good model for CA. Also rain on snow in a deep pack is different than a shallow pack so would resist the scare statement of rain on snow causing catastrophic flooding. Elevated flood risk now due more to limited surface reservoir space than melting snow with the AR based rain. AR based rain enough of a problem on its own. Thanks for working on this. I appreciate the help in characterizing the impact of these storms

Mike

Heavy Rainfall and Full Reservoirs: Does SWE matter?

Wed 1/25/2017 6:14 PM

Noah Paul Molotch

RE: map of SWE anomaly for press release

To 'Anderson, Michael L.@DWR'

Also, and I pulled this out of the press release, but it is worth noting that I agree RE a deep snowpack being able to buffer a rain event. That said, and what I was referring to, is that we have a lot of relatively shallow snow at lower elevation (that is anomalous) and given the large land area covered by this snow, if we get another very intense AR and it comes as rain, the rain-on-snow could be an important aspect of flood risk (I didn't say "catastrophic"). Anyway, just want to make sure DWR realizes that this risk may be greater right now because of the abnormal low elevation snow storage. We need more research on rain-on-snow; maybe we should discuss this in the context of our collaboration?

Cheers, Noah

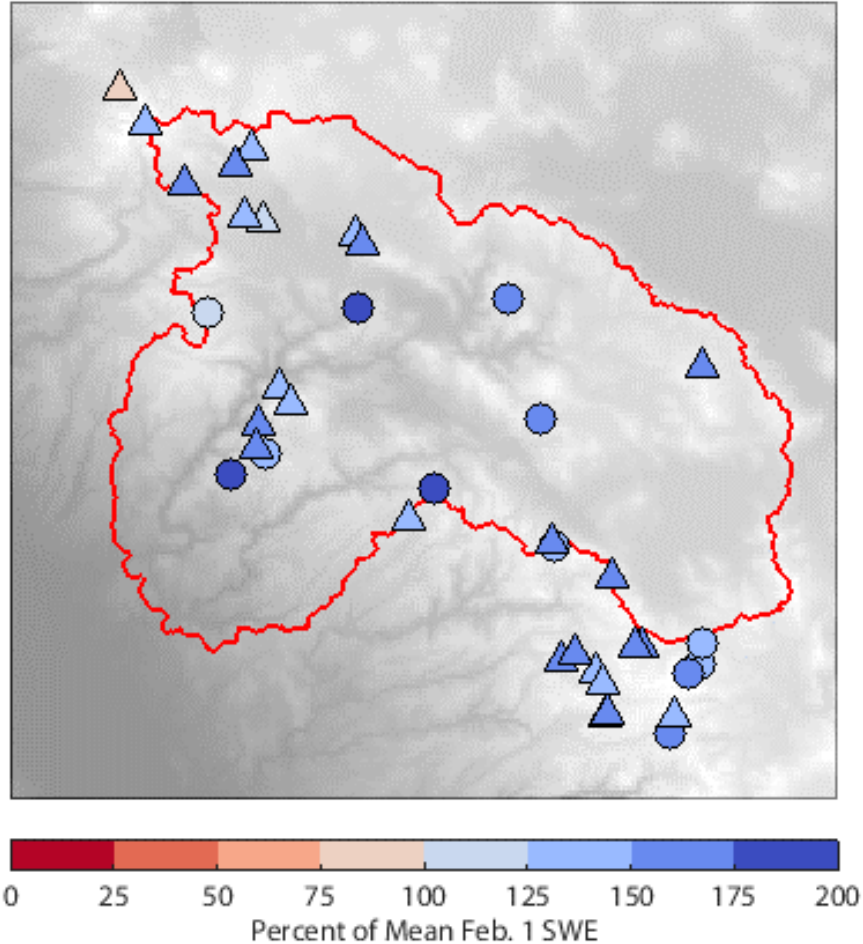

Oroville Disaster: Rain-on-Snow?

- Largest storage facility in CA State Water Project.
- Damage: 45 feet deep, 300 feet wide, and 500 feet long.
- ~\$200 Million Damage
- 188,000 People evacuated

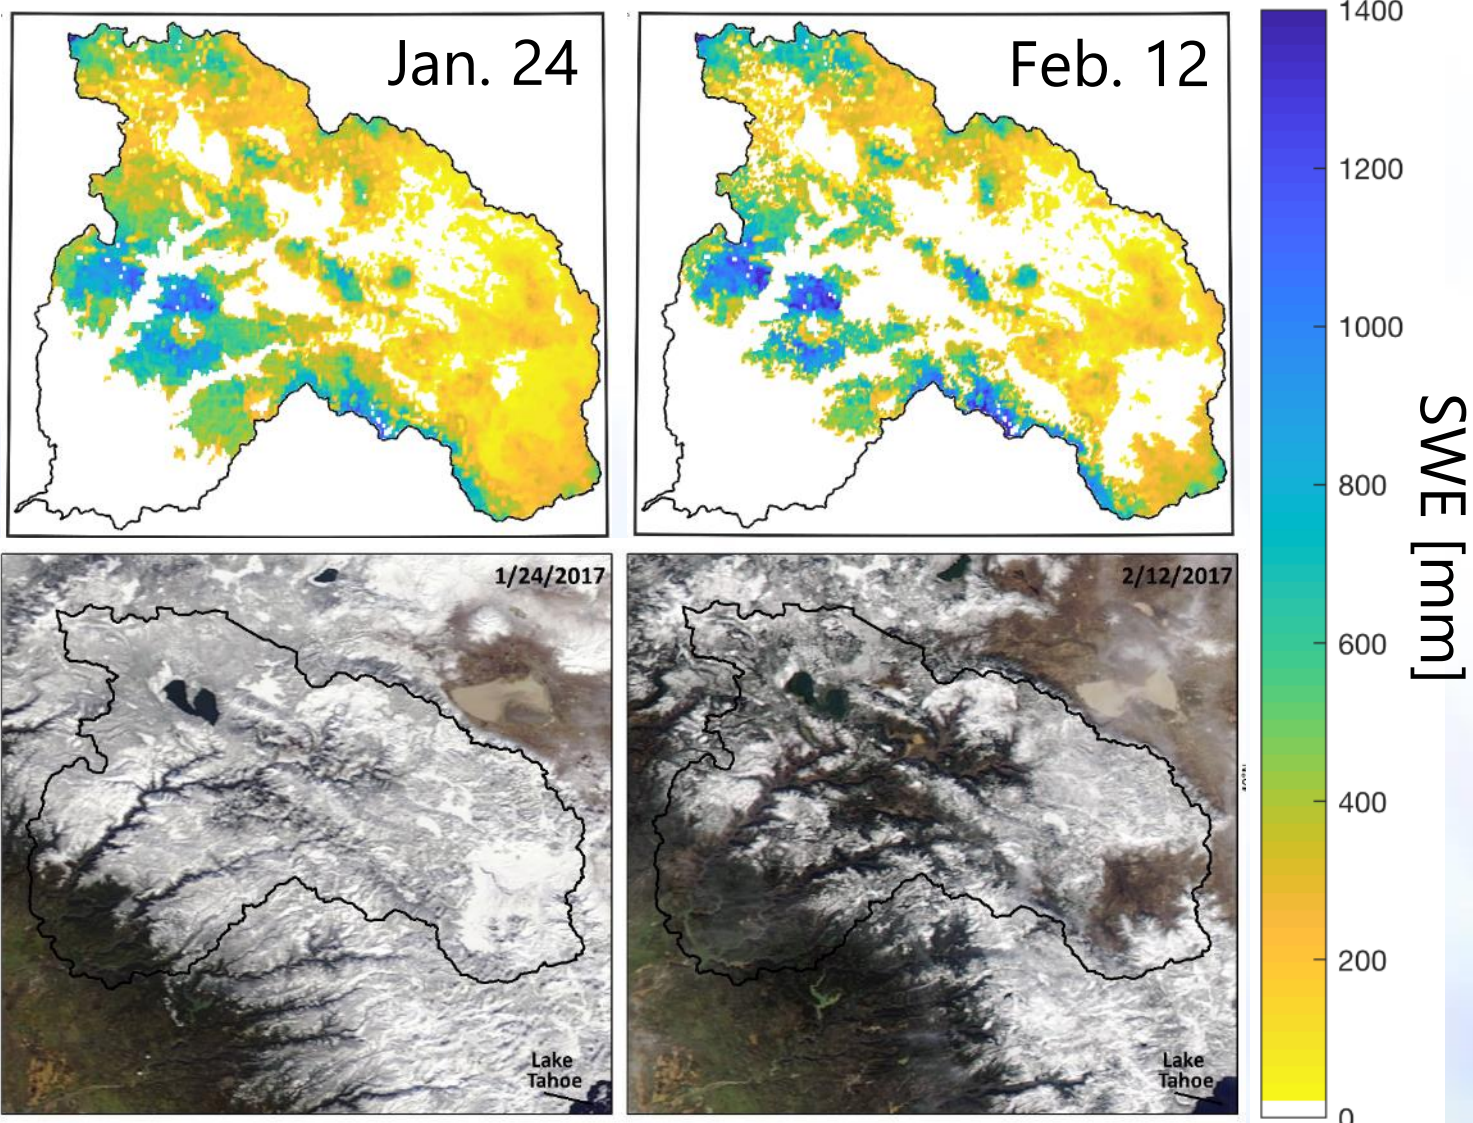

Antecedent Snowpack

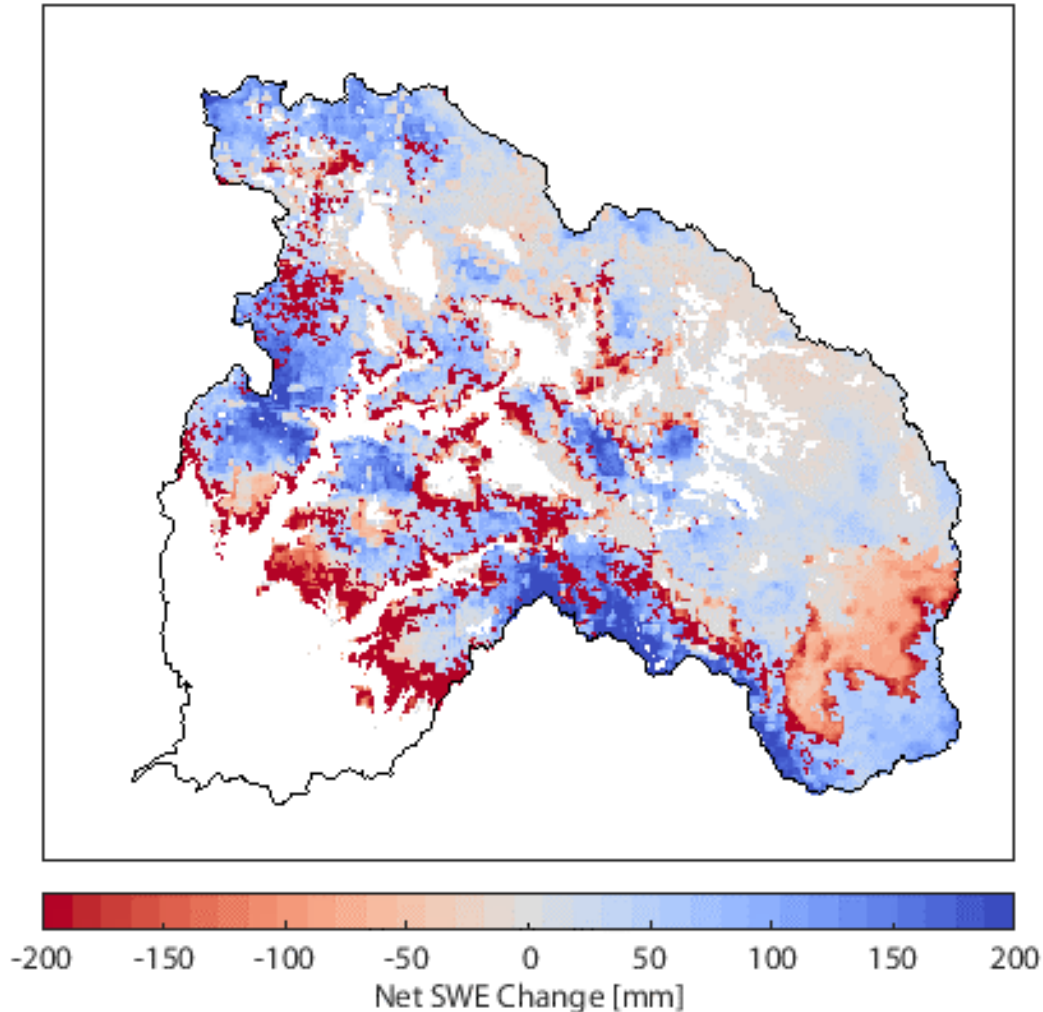

- Antecedent snowpack far above February 1 long-term average (160% of normal) after very active AR sequence in January
- SWE above average at all elevations with pillows/courses

SWE maps before and after the flood event show significant snowmelt

- CU / JPL gridded SWE estimates before & after the flood event
- MODIS clear-sky images on January 24 and February 12, 2017 show snow loss.

Basin-wide snowpack losses contributed 11% to the flood wave: CU/JPL SWE Product

- 1.02 in. SWE loss averaged over Feather River Basin between Jan. 24 and Feb. 12
- 9 in measured precipitation over basin
- total water available for streamflow generation was 11% higher due to snowmelt

An integrated SWE observing system

Merging satellite data with airborne and ground data to estimate SWE

- Ground data:
 - Truth
 - Long record
 - Limited in space
- Airborne data:
 - Accurate
 - High resolution
 - Limited in extent and frequency (\$\$)
- Satellite data
 - Large extent
 - Frequent sampling
 - Limited in resolution and accuracy

How can remotely sensed SWE information improve water supply forecasts?

CONCLUSIONS

- Flood risk assessment: real time SWE mapping illustrates that 11% of the Oroville-event flood wave was associated with snowmelt / rain-on-snow
- Drought impact assessment: SWE products show a snow-water deficit of 54 Million Acre Feet going into the 2018 water year
- Integrated measurement approach is imperative for water resources sustainability.
- California MUST lead the way.....
